### Moderator 32 dB for hunting or firing weapon partially enclosing the barrel of the rifle

Light alloy sound modulator designed for hunting or shooting rifles. The moderator is structured around a first decompression chamber that partially encloses the barrel (used to reduce the pressure and absorb some of the sound), followed by 6 conical baffles and a final chamber forming the mouth.

- Decrease of 32 decibels with subsonic ammunition
- Simple cleaning and without disassembly.
- Total length 22.5 cm including 10 cm around the barrel.
- Reduces the risk of deterioration of hearing for shooters and hunters.

Sound moderators, sometimes called improperly silent, can reduce the sound of the shot. If the projectile is subsonic, the shot will be very quiet. If the projectile is supersonic, the sound of the start will be attenuated, but the projectile will still create a supersonic bang that agrees on the trajectory of the shot.
